CHEMISTRY I: ATOMS AND MOLECULES Table of Contents Atoms Electrons and energy Chemical Bonding Chemical reactions and molecules. Learning Objectives Terms Review Questions Links. Atoms Back to Top. Most of the Universe consists of matter and energy. Energy is the capacity to do work. Matter has mass and occupies space. When these charged atoms bond together to form molecules, the bonds are formed by the electrons filling up the outer orbits of the atoms. Since atoms exist independently, there is no bonding in an atom. When atoms combine in different numbers to form a molecule, the end result can vary. When two or more atoms are chemically joined together, this is called a molecule. In some cases, such as hydrogen and oxygen, the molecule is made entirely of the same atom, such as hydrogen gas (a molecule) is made entirely of two hydrogen atoms. Here, converting molecules to atoms is . If molecules contain atoms of different elements, that substance is known as a compound. Mixtures are a combination of two substances like compounds; however, no bonding occurs.
